1. Overview

Since 2014, the Japan Aerospace Exploration Agency (JAXA) has proceeded the project to develop the precise global digital 3D map **“ALOS World 3D” (AW3D)**[*1] covering the global land areas through the use of 3 million scene archives acquired by the PRISM panchromatic optical sensor on the Advanced Land Observing Satellite "DAICHI" (ALOS) operated from 2006 to 2011. The developed digital 3D map consists of digital elevation model (DEM) or digital surface model (DSM) that can represent land terrains with approximately 5 meters in spatial resolution and orthorectified PRISM nadir looking images. The digital 3D map have been utilized in a wide variety of applications such as map development, damage prediction of natural disasters, and water resource investigation.

Based on the AW3D DSM dataset, JAXA is processed and released the “ALOS World 3D-30m” (AW3D30) DSM dataset, which has approximately 30 meters of spatial resolution. AW3D30 dataset is free to use for everyone, therefore we hope that this dataset will be widely used in scientific research, education, and new services based on geospatial information.

1.1. Updates History of AW3D30

Version 1.0 released on May 2015

The first version of the “ALOS World 3D-30m” (AW3D30).

Version 1.1, March 2017

Void values in the cloud and snow pixels between 60 degrees North and 60 degrees South were filled with existing DEMs by the Delta Surface Fill [*2] method.

Version 2.1, April 2018

The source AW3D DSM has been upgraded to version 2. Masks of the land water and low correlation pixels were also filled with existing DEMs in addition to the cloud and snow pixels between 60 degrees north and 60 degrees south. In Japan area, filling was carried out after updating coastline information.

Note that only AVERAGE resampling product is provided from this version since there is not much difference between AVERAGE and MEDIAN product that were contained in previous version.

Version 2.2, April 2019

This is an improved version of the northern region over 60 degrees north. In this version, along with the complement of no-data or low-quality area, updating of coastline was also performed.

Version 3.1, April 2020

This is a version created by reconsidering the format in the high latitude area, auxiliary data and processing method.

Different pixel spacing for each latitude zone was adopted at high latitude area. Coastline data, which is one of the auxiliary data, was changed, and new supplementary data was used. In addition, as a source data for Japan, AW3D version 3 was also used. Furthermore, the method of detecting anomalous values in the process was improved.

First, northern area from 60 degrees south latitude was released in April 2020. The rest will be published at a later date.

2. AW3D30 dataset

2.1. File component

A tile of this dataset covers the unit area of 1 degree latitude and longitude. The tile ID stands for the latitude and longitude at lower-left (southwest) corner. For every tile, the set of files shown in Table 1 is stored as a zip compressed file.

*1: Evaluation items and strategies in comprehensive assessment are as follows.
1) Comprehensive assessment - accuracy: statistical evaluation on the absolute difference from existing global topographic data such as SRTM-3, ASTER GDEM, and ICESat
2) Comprehensive assessment - completeness: evaluation on the area occupancy of cloud and snow mask and land water and low correlation mask to land areas
3) Comprehensive assessment - reliability: statistical evaluation on the histograms of correlation coefficients in stereo-pair matching and on stacking number
Table 5 shows the criteria for comprehensive evaluation

*2: Descriptions of source products are applicable for v2.1 or later ('-' indicates the tile was not made from AW3D)
