

# **K&C Phase 3**

## ***Australian R&D Support to Global Forest and Above Ground Biomass Mapping***

Richard Lucas  
*University of New South Wales*

John Armston, Peter Scarth, Stuart Phinn, Tony Gill  
*Joint Remote Sensing Research Program – University of Queensland*

Daniel Clewley  
*University of Southern California*

Peter Bunting  
*Institute of Geography and Earth Sciences, Aberystwyth University*

Randall Donohue  
*CSIRO Land & Water*

## Presentation Outline

- ☐ **JAXA project area, objectives, schedule and deliverables**
- ☐ Australian validation data collation
- ☐ Persistent Green Vegetation from Landsat
- ☐ Large area segmentation of PALSAR/Landsat products
- ☐ Regional forest regrowth extent mapping development
- ☐ Australian vertical apparent foliage profile product development
- ☐ Australian above-ground biomass product development
- ☐ Case studies of mapping and modelling biomass change

## Project area

- ☐ Focus initially on Queensland, Australia
  - Injune Study Site key case study
- ☐ Extension to New South Wales, Victoria and the Northern Territory (JRSRP)
- ☐ Subsequent application across Australia

## Project area

- ☐ Focus initially on Queensland, Australia
  - Injune Study Site key case study
- ☐ Extension to New South Wales, Victoria and the Northern Territory (JRSRP)
- ☐ Subsequent application across Australia

## Project objectives

**Objective:** To provide R&D support to the generation of JAXA's global forest/non-forest and above ground biomass maps

- Advance development and validation of algorithms for Australian conditions
- Support quantification of forest/non-forest extent and change, biomass (carbon), biomass change and associated carbon losses and gains
- Supports *K&C thematic drivers*
  - Carbon cycle science – deliverables are input to carbon data assimilation schemes (CSIRO) and carbon offsets research
  - Environmental Conservation – regional mapping at a scale relevant to land management and State Government vegetation management policy

## Project schedule (revised)

### ☐ December, 2013

- Revised approach to generation of forest/non-forest maps from Landsat sensor data
- Extension of AGB map based for Queensland to NSW, the Northern Territory and Victoria (Version 1.0)
- Generation of vegetation height map for Australia

### ☐ March, 2014

- Generation of Version 2.0 of a 30 m spatial resolution map of AGB for eastern and northern Australia

### ☐ April, 2015

- Generation of above-ground biomass and forest change maps
- Extension to all of Australia

## Support to JAXA' s global forest mapping effort

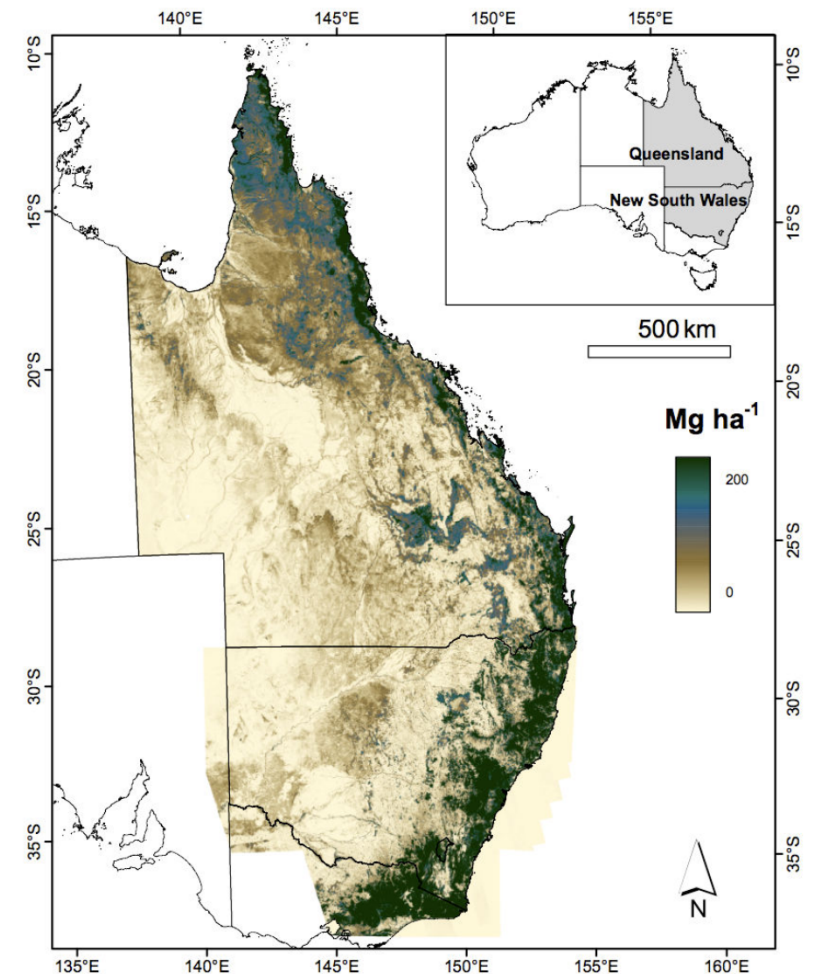

- Supports JAXA' s global forest mapping effort in Australia
  - Improved local calibration and validation of mapping, particularly for woodlands and savannas
  - Application of datasets and access to research products through national collaborative research programs and infrastructure such as TERN
- Collation and standardisation of ground and airborne datasets that will be shared with JAXA
  - Field observations of forest extent and AGB (“biomass library”)
  - Ground and airborne lidar data archives

## Deliverables

Project deliverables and anticipated results:

- Baseline vegetation maps for 2009
  - Regional forest regrowth extent mapping (Brigalow Belt Bioregion complete)
  - Vertical foliage profile product for Australia (in progress)
  - Above-ground biomass for Australia (in progress)
- Validation of JAXA K&C mapping products

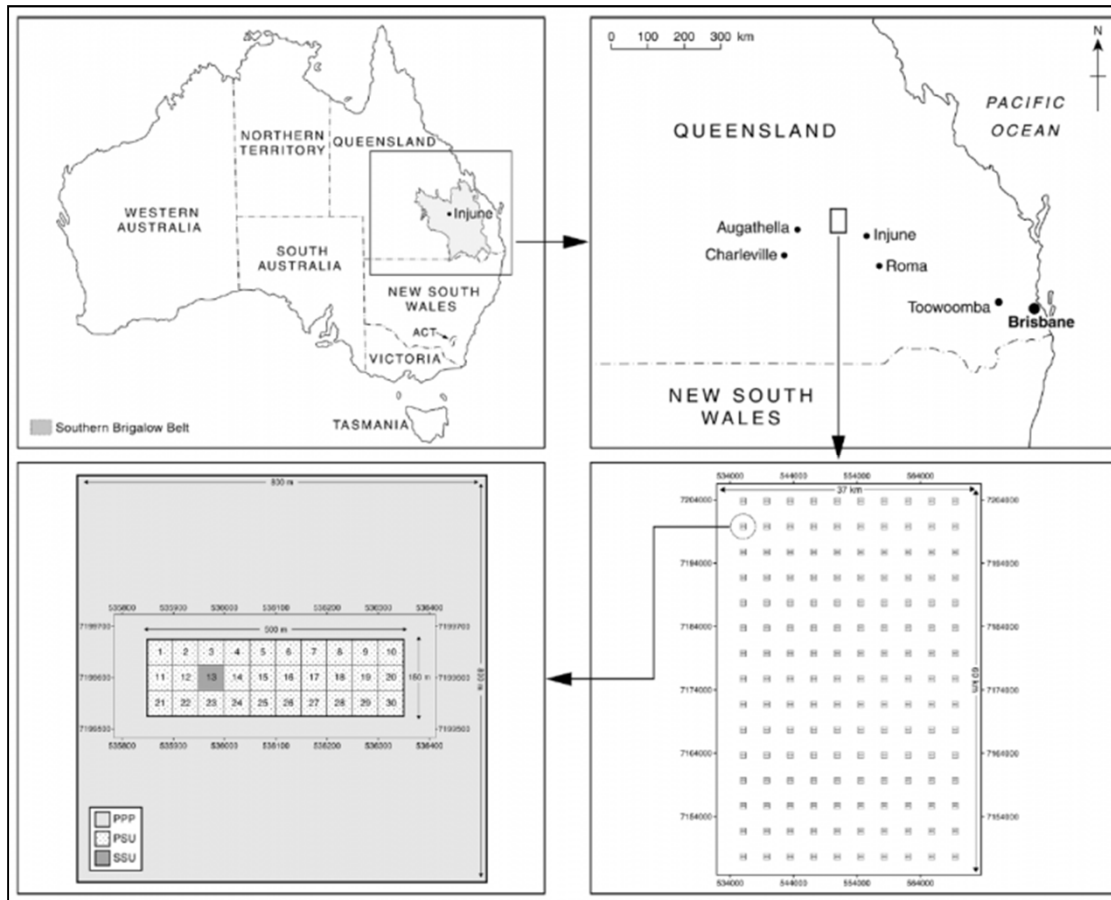

## Presentation Outline

- ☐ JAXA project area, objectives, schedule and deliverables
- ☐ **Australian validation data collation**
- ☐ Persistent Green Vegetation from Landsat
- ☐ Large area segmentation of PALSAR/Landsat products
- ☐ Regional forest regrowth extent mapping development
- ☐ Australian vertical apparent foliage profile product development
- ☐ Australian above-ground biomass product development
- ☐ Case studies of mapping and modelling biomass change

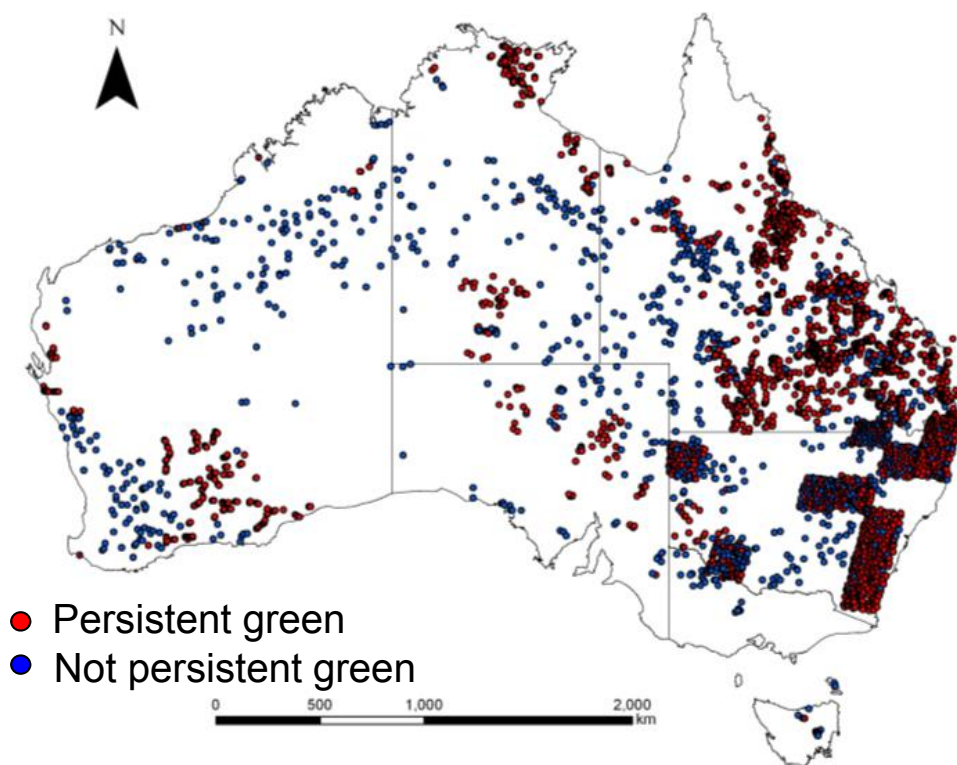

## The Injune Landscape Collaborative Project

## Forest and woodland extent observations

- Approximately 5100 sites of which 3800 are persistent green

Source	Description
Queensland DSITIA	Fractional cover field sites
ABARES	Fractional cover field sites
NSW OEH	Image-interpretation of woody/not-woody vegetation cover
NT Bushfires	DBH field sites
NT NRETAS	Fractional-cover field sites
ACRIS	Locations of low-foliage scrub
WA	woody-vegetation sampling sites
QLD Herbarium	Biomass field sites

## Above-ground biomass library

Collation of plot-based measurements of stem DBH ongoing:

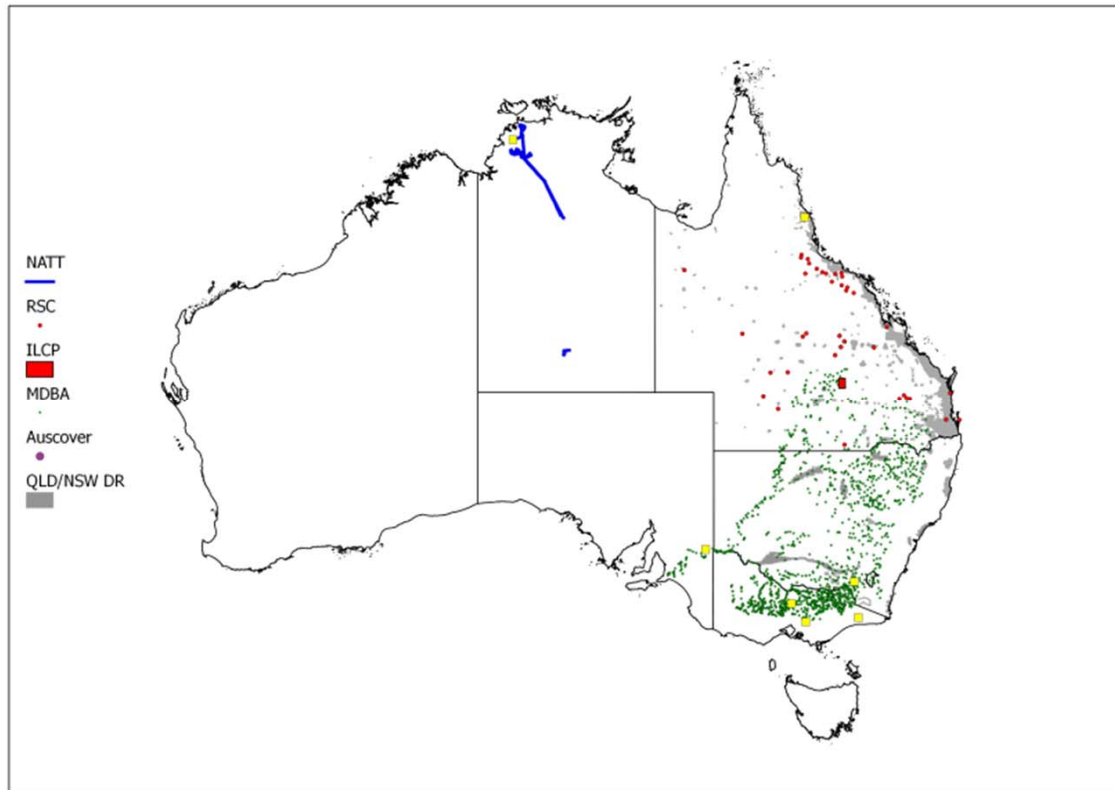

- Extension of K&C Phase 2 biomass library
- >2000 sites

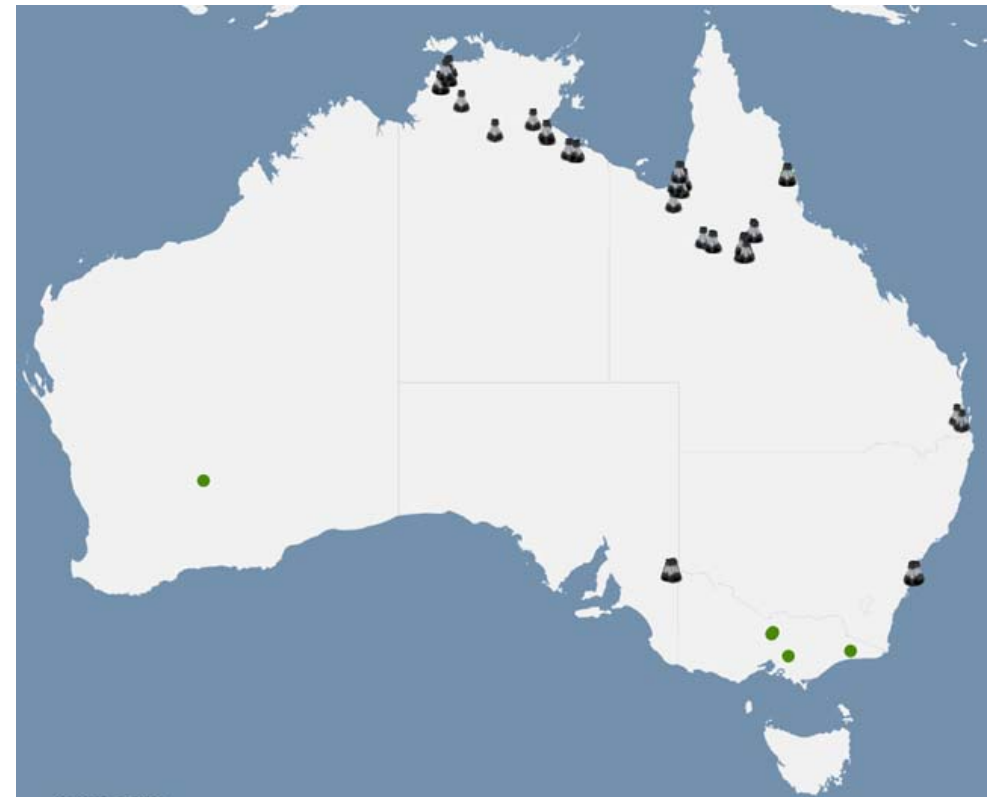

Source	Description
Queensland Herbarium	Carbon Accumulation Through Ecosystem Recovery (CATER) project
Victoria DSE	Large and Small Tree Plots
James Cook University	Robson Creek 25 ha stem inventory
TERN Auscover	Supersite field plots
Northern Territory Government	Basal area field sites
NT Bushfires	DBH field sites
Forestry Tasmania	Warra 1 ha stem inventory

## Lidar data acquisition and collation

### Airborne

### Ground

## Ground-based lidar

	Field	Riegl
DBH (cm)	61.9	60.85
Height (m)	28.2	27.28
Volume (m <sup>3</sup> )	-	6.4022
Biomass (kg)	3194.93 <sup>1</sup>	4673.61

<sup>1</sup>Allometric Williams *et al.* (2005). SG=0.73.

## Presentation Outline

- ☐ JAXA project area, objectives, schedule and deliverables
- ☐ Australian validation data collation
- ☐ **Persistent Green Vegetation from Landsat**
- ☐ Large area segmentation of PALSAR/Landsat products
- ☐ Regional forest regrowth extent mapping development
- ☐ Australian vertical apparent foliage profile product development
- ☐ Australian above-ground biomass product development
- ☐ Case studies of mapping and modelling biomass change

## Landsat pre-processing

Landsat at-sensor radiance

## Landsat pre-processing

Nadir-adjusted surface reflectance

## Fractional cover

- Fractional cover uses a constrained unmixing model with endmembers derived from field sampling.
- Creates an image with the percentage bare, green and non-green fractions
- Over 800 field sites collected using a consistent, nationally agreed protocol
- Overall RMSE of 11%

## Persistent Green Fraction

- Robust regression fit to time series of green fraction – robust to account for outliers due to misclassified cloud (or other masked pixel).
- Persistent areas show low variation in green fraction within the time series, and a minimum above a threshold.
- Improved estimation of forest/non-forest
