## 1.1.2. Data Format Structure for 1CGMI – GPM Common Calibrated Brightness Temperature

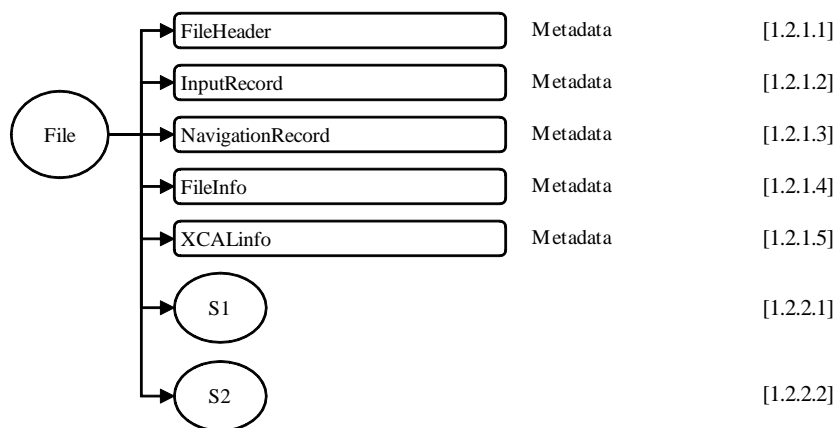

1CGMI contains common calibrated brightness temperatures from the GMI passive microwave instrument flown on the GPM satellite. 1C-R GMI is a remapped version of 1CGMI which is explained at the end of this section. Swath S1 has 9 channels which are similar to TRMM TMI (10V 10H 19V 19H 23V 37V 37H 89V 89H). Swath S2 has 4 channels similar to AMSU-B (165V 165H 183+/-3V 183+/-8V). Data for both swaths is observed in the same revolution of the instrument.

Earth observations are taken during a segment of the rotation when GMI is looking in the +x direction of the GPM satellite. Since the spacecraft turns around every few weeks, +x may be forward or aft. We define the spacecraft axis v, used in the definition of the variable SCorientation, at the center of this segment and the same as the +x direction.

$$32\text{rpm} * 1\text{min}/60\text{s} * 5538\text{s}/\text{orbit} = 2954 \text{ scans / orbit.}$$

RELATION BETWEEN THE SWATHS: Swath S2 has the same number of scans and the same number of pixels as Swath S1. Each S1 scan contains 9 channels sampled 221 times along the scan. Each S2 scan contains 4 channels sampled 221 times along the scan. Since the incidence angle of Swath S1 is different than Swath S2, the geolocations of the pixel centers are different.

1C-R GMI is a remapped version of 1CGMI. 1C-R is the input for Gprof. The 1C-R Swath S1 is the same as the 1C Swath S1. However, the 1C-R Swath S2 consists of pixels selected from 1C Swath S2 to be as close as possible to the S1 pixels. The 1C-R S2 pixels will often be observed at a different scantime and sometimes from a different granule than the corresponding S1 pixel. Since 1C S2 is narrower than 1C S1, 1C-R S2 has missing pixels on both edges of the swath.

Therefore NumberScansInSet=1 for the low frequency swath and NumberScansInSet=2 for the high frequency swath.
MaximumNumberScansTotal	50	The maximum allowed number of total scans in this swath. Total scans = overlap scans before granule + scans in granule + overlap scans after granule.

### 1.2.2.2 S2 (Swath)

#### (1) S2\_SwathHeader (Metadata)

S2\_SwathHeader contains metadata for swaths.

**Table 1.2-16 S2\_SwathHeader Group**

Metadata Element	Estimated Size (bytes)	Description
NumberScansInSet	50	The scans read by TKreadScan are a "set". For single swath data, one scan is read so NumberScansInSet=1. For multiple swath data, one TKreadScan may read more than one scan. For example, for SSM/I data one TKreadScan reads one low frequency scan and two high frequency scans. Therefore NumberScansInSet=1 for the low frequency swath and NumberScansInSet=2 for the high frequency swath.
MaximumNumberScansTotal	50	The maximum allowed number of total scans in this swath. Total scans = overlap scans before granule + scans in granule + overlap scans after granule.
NumberScansBeforeGranule	50	The number of overlap scans before the first scan of the granule in this swath.
NumberScansGranule	50	The number of scans in the granule in this swath.
NumberScansAfterGranule	50	The number of overlap scans after the last scan of the granule in this swath.
NumberPixels	50	The number of IFOV in each scan in this swath.

## 2.1.2. Data Format Structure for 1CTMI – GPM Common Calibrated Brightness Temperature

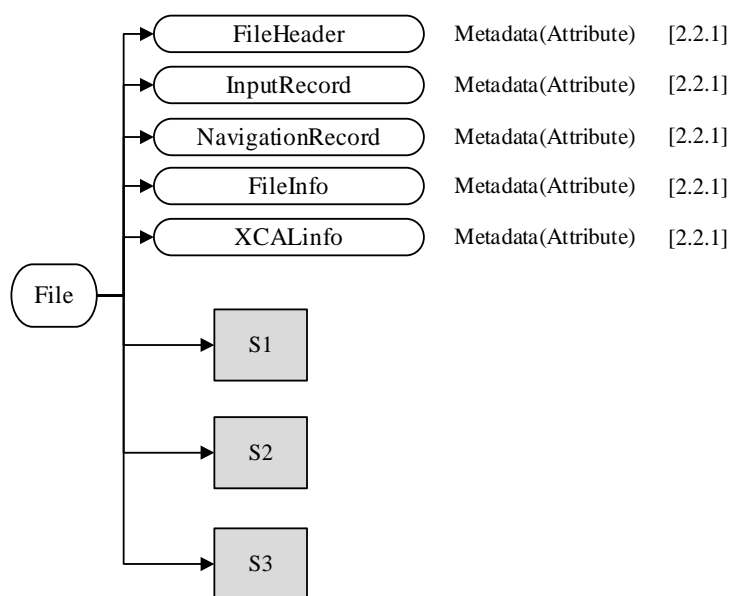

1CTMI contains common calibrated brightness temperatures from the TMI passive microwave instrument flown on the TRMM satellite. There are 3 swaths. Swath S1 has 2 low resolution channels (10V 10H). Swath S2 has 5 low resolution channels (19V 19H 21V 37V 37H). Swath S3 has 2 high resolution channels (85V 85H). Data for all swaths is observed in the same revolution of the instrument.

Earth observations are taken during a segment of the rotation when TMI is looking in the +x direction of the TRMM satellite. Since the spacecraft turns around every few weeks, +x may be forward or aft. We define the spacecraft axis v, used in the definition of the variable SCorientation, at the center of this segment and the same as the +x direction.

RELATION BETWEEN THE SWATHS: Swath S2 has the same number of scans and pixels as Swath S1. Swath S3 has the same number of scans but twice as many pixels as Swath S1. Each S1 and S2 scan contains low frequency channels sampled 104 times along the scan. Each S3 scan contains high frequency channels sampled 208 times along the scan. S1 S2 and S3 scans are repeated every 1.9s. Along an S1 scan every other center of an S3 pixel coincides with the center of an S1 pixel.

The Figure below shows the locations of the pixels of scans 1 and 2 for Swath 1 and Swath 3. Each "+" represents centers of pixels from one or more swaths. For example, the label " S1:1,2 S3:1,3" means that both Swath S1, Scan 1, Pixel 2 and Swath S3, Scan 1, Pixel 3 are located at the "+".

StartGranuleDateTime	50	The start time defining this granule. The format is the same as GenerationDateTime. **(1) S3\_SwathHeader (Metadata)**

S3\_SwathHeader contains metadata for swaths.

**Table 2.2-28 S3\_SwathHeader Group**

Metadata Element	Estimated Size (bytes)	Description
NumberScansInSet	50	The scans read by TKreadScan are a "set". For single swath data, one scan is read so NumberScansInSet=1. For multiple swath data, one TKreadScan may read more than one scan. For example, for SSM/I data one TKreadScan reads one low frequency scan and two high frequency scans. Therefore NumberScansInSet=1 for the low frequency swath and NumberScansInSet=2 for the high frequency swath.
MaximumNumberScansTotal	50	The maximum allowed number of total scans in this swath. Total scans = overlap scans before granule + scans in granule + overlap scans after granule.
NumberScansBeforeGranule	50	The number of overlap scans before the first scan of the granule in this swath.
NumberScansGranule	50	The number of scans in the granule in this swath.
NumberScansAfterGranule	50	The number of overlap scans after the last scan of the granule in this swath.

**(10) incidenceAngleIndex (1-byte integer, array size: nchannel3 x nscan3)**

Index (1 based as in Fortran) of the incidence angle array corresponding to the channel.

For example, if the swath has 10 channels and 2 unique incidence angles, then the dimensions in Fortran would be:

```
incidenceAngle(2,npixel,nscan)
sunGlintAngle(2,npixel,nscan)
incidenceAngleIndex(10,nscan)
Tc(10,npixel,nscan)
```

The user would do the following to retrieve the angles for a given channel, pixel, and scan:

```
i = incidenceAngleIndex(channel,scan)
ia = incidenceAngle(i,pixel,scan)
sga = sunGlintAngle(i,pixel,scan)
```

The incidenceAngleIndex is the same for every scan, but is repeated each scan for the convenience of users reading the data scan by scan. In addition, incidenceAngleIndex is located in metadata for the convenience of users wishing to read this information from metadata.

Values range from 0 to 100. Special values are defined as:

### 3.1.2. Data Format Structure for 1CAMSR2 – Common Calibrated Brightness Temperature

1CAMSR2 contains common calibrated brightness temperature from the AMSR2 passive microwave instrument flown on the GCOMW1 satellite. This products contains 6 swaths. Swath 1 has channels 10.65V 10.65H. Swath 2 has channels 18.7V 18.7H. Swath 3 has channels 23.8V 23.8H. Swath 4 has channels 36.5V 36.5H. Swath S5 has 2 high frequency A-Scan channels (89V,89H). Swath S6 has 2 high frequency B-Scan channels (89V,89H). Data for all six swaths is observed in the same revolution of the instrument. High frequency A and high frequency B data are observed in separate feedhorns. RELATION BETWEEN THE SWATHS: Each S1 scan contains 10 GHz channels sampled 243 times along the scan. S2, S3, and S4 are sampled nominally at the same position as the S1 samples, but differ by small distances. Each S5 scan contains high frequency A channels sampled 486 times along the scan. Each S6 scan contains high frequency B channels sampled 486 times along the scan. Both Swath S5 and Swath S6 have exactly twice as many pixels as Swath S1. S1 pixels 1, 2, 3, ... coincide with S5 pixels 1, 3, 5, ... Scans of all swaths are repeated every 1.5s and the scans of one swath are about 10km apart along the direction of the satellite track. Along an S1 scan every other center of an S5 pixel coincides with the center of an S1 pixel, but the S6 pixels are offset from S1 and S2 pixels by nominally 15km in the direction normal to the scan direction on the aft side, in other words S6 pixels are nominally 15km "behind" the S1 and S5 pixels for the same scan.

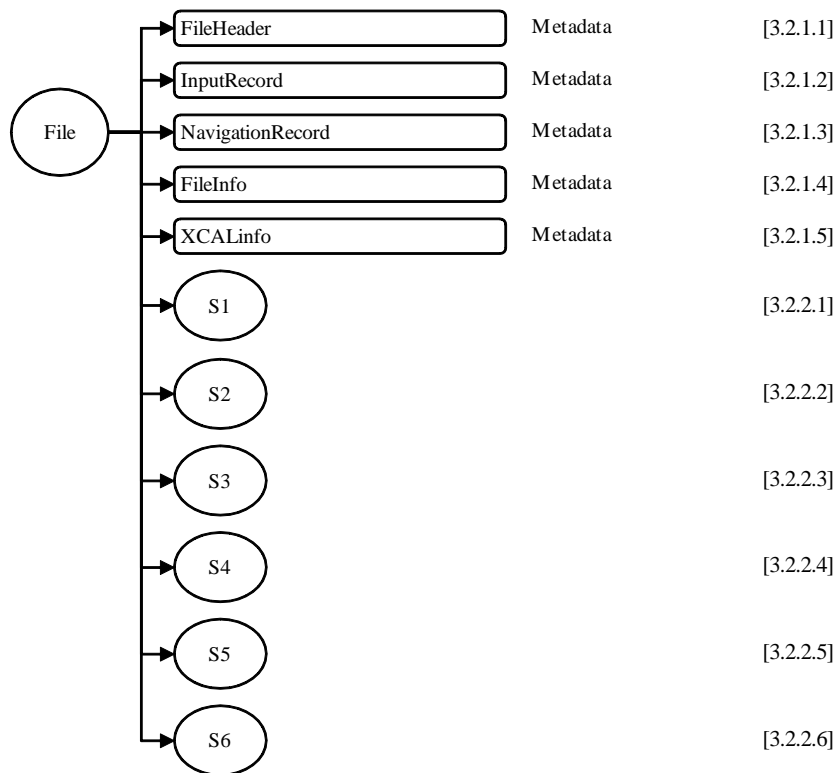

The Figure below shows the locations of the pixels of scans 1 and 2 for swaths S1, S5, and S6. Since swaths S2, S3 and S4 are close to S1, they are omitted from the figure. Each "+" represents centers of pixels from one or more swaths. For example, the label "S1:1,2 S5:1,3" means that both Swath S1, Scan 1, Pixel 2 and Swath S5, Scan 1, Pixel 3 are located at the "+".

### 3.2.2.6 S6 (Swath)

#### (1) S6\_SwathHeader (Metadata)

S6\_SwathHeader contains metadata for swaths.

**Table 3.2-61 S6\_SwathHeader Group**

Metadata Element	Estimated Size (bytes)	Description
NumberScansInSet	50	The scans read by TKreadScan are a "set". For single swath data, one scan is read so NumberScansInSet=1. For multiple swath data, one TKreadScan may read more than one scan. For example, for SSM/I data one TKreadScan reads one low frequency scan and two high frequency scans. Therefore NumberScansInSet=1 for the low frequency swath and NumberScansInSet=2 for the high frequency swath.
MaximumNumberScansTotal	50	The maximum allowed number of total scans in this swath. Total scans = overlap scans before granule + scans in granule + overlap scans after granule.
NumberScansBeforeGranule	50	The number of overlap scans before the first scan of the granule in this swath.
NumberScansGrAnule	50	The number of scans in the granule in this swath.
NumberScansAfterGranule	50	The number of overlap scans after the last scan of the granule in this swath.

## 4.1.2. Data Format Structure for 1CSSMIS – Common Calibrated Brightness Temperature

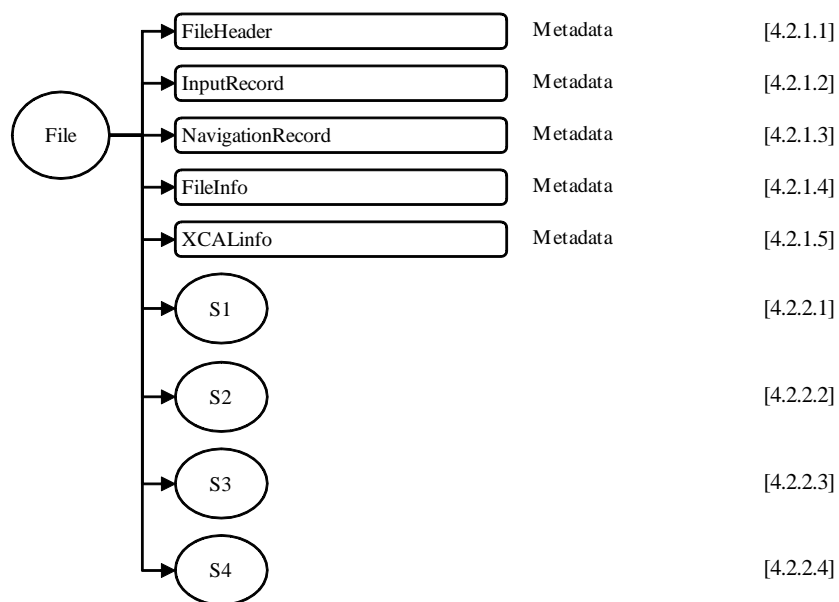

1CSSMIS contains common calibrated brightness temperature from the SSMIS passive microwave instruments flown on the DMSP satellites. Swath S1 has 3 low frequency channels (19V 19H 22V). Swath S2 has 2 low frequency channels (37V 37H). Swath S3 has 4 high frequency channels (150H 183+/-1H 183+/-3H 183+/-7H). S4 has 2 high frequency channels (91V 91H). All the above frequencies are in GHz.

Earth observations for all four swaths are taken during a 144° segment of the instrument rotation when SSMIS scans in the direction of forward satellite motion. We define the spacecraft vector ( $v$ ) at the center of this segment. "v" is used in the definition of the variable SCorientation.

RELATION BETWEEN THE SWATHS: Each S1 and S2 scan contains low frequency channels sampled 90 times along the scan. Each S3 and S4 scan contains high frequency channels sampled 180 times along the scan. All four swaths have exactly the same number of scans. All four swaths repeat scans every 1.9s. The earth positions of S1 are very close to those of S2. The earth positions of S3 are very close to those of S4. The earth positions of S1 and S2 alternate with those of S3 and S4 along the satellite track. The positions of the S1 and S2 pixels do not match the positions of the S3 and S4 pixels.

The Figure below shows the locations of the samples of Swath S1 and Swath S2 scan 1 and Swath S3 and Swath S4 scan 1. Each "+" represents centers of samples from two swaths. For example, the label "S1S2:1,2" means that Swath S1 and Swath S2, scan 1, sample 2 is located approximately at the "+". The positions of S1 and S2 are slightly different from each other but close enough to be represented by the same "+" in the Figure. The positions of S3 and S4 are slightly different from each other but close enough to be represented by the same "+" in the Figure.

### 4.2.1. Metadata

#### 4.2.1.1 FileHeader

FileHeader contains metadata of general interest. Table 4.2-1 shows each metadata elements in FileHeader.

**Table 4.2-1 FileHeader Group**

Metadata Element	Estimated Size (bytes)	Description
DOI	256	Digital Object Identifier *Value is blank currently
DOIauthority	256	Digital Object Identifier Authority.
DOIshortName	256	Digital Object Identifier Short Name. *Value is blank currently.
AlgorithmID	50	The algorithm that generated this product, e.g., 2A12.
AlgorithmVersion	50	The version of the algorithm that generated this product.
FileName	50	The file name of this granule.
SatelliteName	10	Values are: TRMM GPM MULTI F10 ... F18 AQUA GCOMW1 CORIOLIS MT1 NOAA15 ... NOAA19 METOPANPP. More values will be added as they are known.
InstrumentName	10	Values are: PR TMI VIRS PRTMI KU KA DPR GMI DPRGMI MERGED SSMI SSMIS AMSRE AMSR2 WIND-SAT MADRAS AMSUA AMSUB SAPHIR MHS ATMS. More values will be added as they are known.
GenerationDateTime	50	The date and time this granule was generated. The format is YYYY-MM-DDTHH:MM:SS.sssZ, where YYYY is 4-digit year, MM is month number, DD is day of month, T is "T", HH is hour, MM is minute, SS is second, sss is millisecond, and Z is "Z". All fields are zero-filled. The missing value is constructed by replacing all digits with 9, i.e., 9999-99-99T99:99:99.999Z
StartGranuleDateTime	50	The start time defining this granule. The format is the same as GenerationDateTime. DETAILS: An orbital granule starts when the satellite is at the position defined by GranuleStart. Thus the start time is not the first scan time. Some algorithms have overlap scans in the file before the start time as defined in SwathHeader. A monthly granule starts on the first ms of the month, for example March 1998 would be 1998-03-01T00:00:00.000Z
StopGranuleDateTime	50	The stop time defining this granule. The format is the same as GenerationDateTime. DETAILS: An orbital granule stops when the satellite is at the position defined by GranuleStart. Thus the stop time is not the last scan time. Some algorithms have overlap scans in the file after the stop time as defined in SwathHeader. A monthly granule stops on the last ms of the month, for example March 1998 would be 1998-03-31T23:59:59.999Z
GranuleNumber	50	The number of this granule, which starts as in GranuleStart. If the GranuleStart is identical to the orbit start, then the GranuleNumber will be the same as the orbit number. The GranuleNumber will have 6 digits, including leading zeroes, for example 001234.
NumberOfSwaths	50	The number of swaths in this granule.
NumberOfGrids	50	The number of grid structures in this granule.
GranuleStart	50	The starting place in the orbit of this granule. Currently defined values are "SOUTHERNMOST LATITUDE" and "NORTHBOUND EQUATOR CROSSING".

The polarization vector is parallel to the scan plane at nadir.

QH means quasi-horizaontal polarization.

Note on geolocation and 1C swaths;

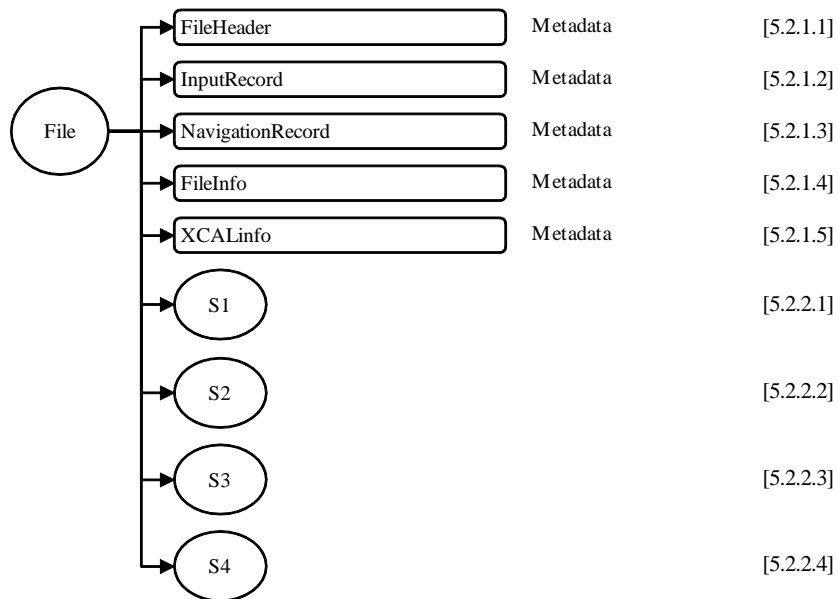

The BeamLatitude and BeamLongitude in ATMSBASE have a band dimentsion of 5. Lat and lon is for channels 1, 2, 3, 16, 17. Each 1C swath will contain one band:

1C swath	Band	IEEE GHz	Ch geo	Chs in band
1	K	18-26.5	1	1
2	A(Ka)	26.5-40	2	2
3	W	75-110	16	16
4	G	110-300	17	17-22

Note that channels 3-15 are Not Included in the 1C product.

1CATMS contains 4 swaths, one for each band K, A(Ka), W, and G.
